| Description I have a number of 'frozen' repos which I copy rpm's to weekly by script. To check when the repo was last updated with any content, I've been checking the 'Last Unit Added' attribute for the repo with the command: \$ pulp-admin rpm repo search --str-eq "id=<reponame>" After updating to pulp 2.9.2 (from 2.7.0) this field is no longer updated. I've now also updated to 2.11 but the problem persists. I also have several repos that are synced from external sources nightly, and the 'Last unit added' field is not updated on these either. Is this a bug or am I doing something wrong? When is this field supposed to get updated? What is the correct way to determine when (date/time) a specific repo was last updated with new content? | |
