Description

When trying to debug problems of pulp_docker - last time it was validate_config failing on wrong naming (uppercase in chars in repo name) without specific error - it has really weak logging of errors compared to other pulp plugins - for example rpm.
Would it be possible to add same logging capability to docker plugin - please compare:

```
https://github.com/pulp/pulp_rpm/blob/master/plugins/pulp_rpm/plugins/distributors/yum/configuration.py
```

versus

```

```
