Description			
<p>I think the docs would benefit from a small section added to them to documenting Pulp's webserver expectations. I believe all that is required is that it's a WSGI process and that it own the entire namespace.</p> <p>This means that Pulp cannot be run side by side another application. They could use SNI to configure multiple vhosts on one server though so it's still about to run multiple sites, just not on one domain. The reason this would be required is that content types that require live APIs, e.g. crane, puppet forge, etc, they can have hard-coded urls. Only if all urls are passed and matched by Django can Pulp fulfil this use case.</p>
