Sprint Candidate: No	

Description

This machinery should run when a release tag is pushed indicating a new release, similar to how plugins publish to PyPI already. When activated it should:

1. Install the plugin on top of the generic, most recent core container.
2. start that container and run pulp-smash tests against it
3. If all the tests pass, publish the container to quay.io with credentials

The credentials need to be configured somehow in the config files.
