Description

Add the possibility to query the file name ("location_href?") of a package in the contents.

This simplifies the use of jq as we get directly the good href with the use of a GET query

```
http :24817/pulp/api/v3/content/rpm/packages/?filename=name-version-release.arch.rpm
```

I prefer the query version than using jq

```
http :24817/pulp/api/v3/content/rpm/packages/ | jq -r '.results[] | select( .location_href == "name-version-release.arch.rpm") '
```

There could be a limitation when there are too much contents because the pagination prevents to look for all contents.

History

#1 - 05/24/2019 05:19 PM - daviddavis

Just FYI, file name of a package is different than location_href. Location_href could include a path like "Packages/v/VirtualGL-devel-2.5.2-1.el7.x86_64.rpm".
