

Ansible Plugin - Issue #5299

Bindings for pulp \ pulp ansible return python `repr()` for json fields

08/19/2019 06:05 PM - osapryki

Description			
Fields described in DRF serializers as `JSONField()` [1] are included in swagger schema as `string` [2] fields, which leads to invalid deserialization on a client side when using pulp bindings.			
Those fields deserialized as a `str` type containing repr() result of json field passed from server.			
This issue is a blocker, because it cannot be reliably workarounded on a client side as there is no reliable way to deserialize python repr() back to a normal object.
