Description

Motivation

There are cases when a user might want to remove a plugin:

- plugin is no longer in use but it's data in the db is quite large (pulp-2to3-migration case)
- incompatible plugins

Deliverables

- all plugin related data should be removed from the DB, its schema as well
- artifacts can be left for orphan cleanup, don't need to be removed immediately
- it should be possible to install this plugin back again, make sure django migrations are applied in this case accordingly

Original request from Katello

After a pulp2 to 3 migration, the left over migration data is quite large and needs to be cleaned up. there needs to be a command or api to clean it up.

In addition we need a way/instructions to remove the plugin altogether and delete its added schema entirely

#3 - 12/01/2020 06:20 PM - ttereshc

Brought it back to the Pulp tracker, since on the pulpcore meetings we agreed that it makes sense to find a general solution.

#4 - 12/01/2020 09:24 PM - bmbouter

I asked in #django and was told there is no pre-built way to do this. So I imagine we'll ship a custom command.

Is there a programmatic way to identify all the tables brought in by a django app by it's django app name?
