Description

Since the API requires a distribution base_path to publish and download content, this provides a way to configure a default upload/download repo that clients can read.

This also allows clients to look up if content type such as execution environments are supported on the service.

Implement the new v3/configuration endpoint described [here](#).

This API endpoint should return the path as the default upload and download distribution. For example:

pulp_ansible/galaxy/my-distribution/api/v3/ will return my-distribution as the default distribution.

Execution environments will always return as disabled.
