Description

Using 'yum', after downloading default config.repo under /etc/yum.repos.d/, I'm getting the following warning: Repository 'my-repo' is missing name in configuration, using id probably a: name=.... in config.repo should solve

Then I need: sslverify=0 as I'm not using a valid SSL certificate.

Any chance to customize config.repo created in every new RPM distribution?

The warning about the name, we can fix easily, and I will do so now.

There is not currently a way to customize the generated .repo file and I think it might be difficult to do so. We can leave this open to evaluate later.
