Description			
A recent commit to pulp-dev.py added a call to /sbin/systemctl[0]. In F21, systemctl is located in /usr/bin/ instead of /sbin. Due to this change, pulp-dev.py fails to complete successfully which also causes our Vagrant provisioning to fail.

Don't use full path to systemctl in pulp-dev.py.

Not all distributions put the systemctl executable in the same location. pulp-dev.py had been calling it as /sbin/systemctl, but Fedora 21 keeps that executable in /usr/bin/systemctl. This commit calls the executable as just systemctl and allows the PATH variable to be used to locate it.
